Lab- Set global configuration locally

Steps to Follow

1.) To start, let's check the version of the Git installed on our system: -
   Type the command: $ git --version
2.) Configure user information for all local repositories
   a. Add Git username and email address to identify the author while committing the information.
      i. Set the username by using the below command:
         $ git config --global user.name "USERNAME"
      ii. Verify the entered user name with the below command:
         $ git config --global user.name
      iii. Next, set the email address with the below command:
         $ git config --global user.email email_address@example.com
      iv. You can verify the entered email address with the below command:
         $ git config --global user.email
3.) Use the below command to check the configured information user information:
   $ git config --global --list
